

Are there any known issues with using AIM on a Macintosh computer?

The following items have been identified as problems by Infinite Campus.

Microsoft Internet Explorer

Is no longer supported for the Mac platform.

FireFox 2.0.0.1

Does not function properly on MacIntel machines – java is broken in this particular browser version. (ex: Campus gradebook will not function)

There is a Firefox version available for download - specifically built for MacIntels that works very well.

Camino

Camino is supported and is the Mac only version of FireFox, just as BonEcho is the MacIntel only version of Firefox

Microsoft Word documents

When Word documents are downloaded to the AIM servers, the data forks are stripped leaving just the resource fork, rendering them useless for MS Word on a Mac. This is currently being researched and a future resolution is expected.

Acrobat FDF

FDF is the file format used for Acrobat Forms and is used when submitting Form data to a server, receiving a response, and incorporating it back into a Form. There is currently no way to handle FDF's without the full Acrobat Pro. Opening and reading the FDF's is not an issue; however, filling in the check boxes and saving it back to the server is.

Safari

Safari is not currently supported because of a known bug. Apple has assured Infinite Campus that the bug has been resolved in OSX10.5 and Safari 3.0, which are scheduled for release in March/April of 2007.
